(57) **ABSTRACT**

A device and system for providing identification and medical  
information are disclosed. The device includes a readable  
code that contains medical biographical information of the  
subject, a programmable reporter element that is pro-  
grammed to electronically store at least one particular event  
relating to the subject, and a signal producing element func-  
tionally related to the programmable reporter element. The  
system includes collecting and storing medical biographical  
information of a subject, embedding the medical biographical  
information in a readable code of the device, and scanning the  
readable code of the device worn by or in the possession of the  
subject using an appliance to retrieve the medical biographical  
information of the subject. The medical biographical  
information allows medical professionals to obtain the sub-  
ject's medical information in order to provide medical care.  
Also disclosed is an integrated system for alerting subjects to  
upcoming events related to their continued care.

## SYSTEM FOR PROVIDING IDENTIFICATION AND INFORMATION, AND FOR SCHEDULING ALERTS

This application is a Continuation of U.S. patent application Ser. No. 13/917,374, filed on Jun. 13, 2013, which is a Continuation of U.S. patent application Ser. No. 13/313,821, filed Dec. 7, 2011, now U.S. Pat. No. 8,485,439, which is a Continuation-In-Part of U.S. patent application Ser. No. 13/270,672, filed Oct. 11, 2011, now U.S. Pat. No. 8,181,862. The entirety of the aforementioned application is incorporated herein by reference.

### FIELD

This application generally relates to a system for providing identification and/or information; in particular, medical information. The application further relates to an additional system for alerting a subject to upcoming events.

### BACKGROUND

When a subject, to whom lacks the ability to effectively communicate needs urgent medical care, responders typically arrive at the scene within a short period of time without any information regarding the person in distress (i.e., subject). To properly provide medical care, the responders typically ask the subject relevant questions, such as current medications, allergies to medications, prior medical histories, i.e. surgeries, hospital visits, and other conditions. However, even if the subject is alert, he or she typically cannot provide accurate answers to such questions under the circumstances. Consequently, responders often provide urgent medical care without some medical history information. Likewise, after the subject is transported to a medical facility, doctors and other medical personnel at the hospital are not equipped with some of the medical history information regarding the subject, especially if the subject has never gone to the hospital before. Medical personnel may need to contact the subject's physician and/or other hospitals to get the needed information, which can cost time, and potentially life. Therefore, it is a great need for a system which can provide biographical information and allows medical professionals to obtain a subject's medical information.

Additionally, there exists a need for such a system, wherein the system further comprises an integrated element that can remind the subject of upcoming events related to their care and alert practitioners when the subject fails to fulfill those events.

### SUMMARY

One aspect of the present application relates to a removable device that is adapted to be worn or in the possession of the subject, wherein the device comprises: a readable code that contains medical biographical information of the subject, a programmable reporter element that is programmed to electronically store at least one particular event relating to the subject, and a signal producing element functionally related to the programmable reporter element.

Another aspect of the present application relates to a system for providing identification and medical information of a subject in a removable device, comprising: a database for collecting and storing medical biographical information of the subject; a removable device that is adapted to be worn or in the possession of the subject, wherein the device comprises: a readable code that contains medical biographical

2

information of the subject, a programmable reporter element that is programmed to electronically store at least one particular event relating to the subject, and a signal producing element functionally related to the programmable reporter element; and an appliance for scanning the readable code of the device worn by or in the possession of the subject to retrieve medical biographical information of the subject, wherein the retrieved medical biographical information allows responders to obtain the subject's medical information in order to provide care.

Another aspect of the present application relates to a non-transitory computer readable medium providing instructions for providing identification and medical information, the instructions comprising: collecting and storing medical biographical information of a subject; embedding the medical biographical information in a readable code of a removable device that is adapted to be worn by or in the possession of the subject; scanning the readable code of the device worn by or in the possession of the subject using an appliance to retrieve the medical biographical information of the subject; wherein the medical biographical information allows responders to obtain the subject's medical information in order to provide medical care and wherein the device is not linked to a medical sensor and is worn by the subject in a non-hospital setting; and programming a reporter element that provides a signal to a functionally linked signal producing element to inform the subject of at least one particular event relating to the subject, wherein said programming is by a second system that electronically stores at least one particular event relating to the subject.

### BRIEF DESCRIPTION OF THE DRAWINGS

The detailed description will refer to the following drawings, wherein like numerals refer to like elements.

FIG. 1 illustrates an embodiment of the system for providing identification and medical information.

FIG. 2 is a flow charting illustrating an embodiment of the method for providing identification and medical information.

FIG. 3 is a block diagram illustrating exemplary hardware components of the exemplary computer system or server for implementing embodiments of the system and method for providing identification and medical information.

FIG. 4 is a representative schematic view of the elements of the removable device.

### DETAILED DESCRIPTION

The following detailed description is presented to enable any person skilled in the art to make and use the invention. For purposes of explanation, specific nomenclature is set forth to provide a thorough understanding of the present invention. However, it will be apparent to one skilled in the art that these specific details are not required to practice the invention.

Descriptions of specific applications are provided only as representative examples. The present application is not intended to be limited to the embodiments shown, but is to be accorded the widest possible scope consistent with the principles and features disclosed herein.

One aspect of the present application relates to a removable device that is adapted to be worn or in the possession of the subject, wherein the device comprises: a readable code that contains medical biographical information of the subject, a programmable reporter element that is programmed to electronically store at least one particular event relating to the subject, and a signal producing element functionally related to the programmable reporter element.

In particular embodiments, the device is not linked to a medical sensor and is worn by the subject in a non-hospital setting.

In particular embodiments, said reporter element is programmed by a second system that electronically stores at least one particular event relating to the subject. In a further embodiment, the second system additionally alerts a medical practitioner if the subject fails to fulfill the event.

In particular embodiments, the event is an appointment. In a further embodiment, said appointment is a medical appointment. In a still further embodiment, said medical appointment is selected from the group consisting of a physical examination, a physical therapy session, a mental examination and a mental therapy session. In another further embodiment, said appointment is a follow-up to a visit by the subject to a medical facility.

In particular embodiments, the reporter element is programmed to issue a signal a predetermined time prior to the at least one particular event. In a further embodiment, the signal repeats or remains until the subject fulfills the event and the reporter element is reset. In a still further embodiment, the reporter element is reset by a medical practitioner.

In particular embodiments, the device further comprises a tracking circuit that is capable of tracking the subject's location.

In particular embodiments, the medical biographical information includes one or more of the subject's name, sex, date of birth, height, weight, blood type, allergies, sicknesses or medical conditions, use of medications, emergency contacts, and complete medical records.

In particular embodiments, the device is a bracelet or a necklace worn by the subject.

Another aspect of the present application relates to a system for providing identification and medical information of a subject in a removable device, comprising: a database for collecting and storing medical biographical information of the subject; a removable device that is adapted to be worn or in the possession of the subject, wherein the device comprises: a readable code that contains medical biographical information of the subject, a programmable reporter element that is programmed to electronically store at least one particular event relating to the subject, and a signal producing element functionally related to the programmable reporter element; and an appliance for scanning the readable code of the device worn by or in the possession of the subject to retrieve medical biographical information of the subject, wherein the retrieved medical biographical information allows responders to obtain the subject's medical information in order to provide care.

In particular embodiments, the system further comprises a computer screen located in an emergency vehicle to display the retrieved medical biographical information.

In particular embodiments, the system further comprises transmitting the retrieved medical biographical information to a medical facility that is designated to receive the subject.

In particular embodiments, the medical biographical information is updated after the subject is treated at the medical facility.

Another aspect of the present application relates to a non-transitory computer readable medium providing instructions for providing identification and medical information, the instructions comprising: collecting and storing medical biographical information of a subject; embedding the medical biographical information in a readable code of a removable device that is adapted to be worn by or in the possession of the subject; scanning the readable code of the device worn by or in the possession of the subject using an appliance to retrieve

the medical biographical information of the subject; wherein the medical biographical information allows responders to obtain the subject's medical information in order to provide medical care and wherein the device is not linked to a medical sensor and is worn by the subject in a non-hospital setting; and programming a reporter element that provides a signal to a functionally linked signal producing element to inform the subject of at least one particular event relating to the subject, wherein said programming is by a second system that electronically stores at least one particular event relating to the subject.

In particular embodiments, the computer readable medium further comprises instructions for resetting the reporter element after the subject fulfills the event.

In a particular embodiment, the computer readable medium comprises instructions for displaying the retrieved medical biographical information on a computer screen located in an emergency vehicle when the subject needs medical care.

In another particular embodiment, the computer readable medium comprises instructions for transmitting the retrieved medical biographical information to a medical facility that is designated to receive the subject.

In another particular embodiment, the computer readable medium comprises instructions for tracking the subject's location using a tracking circuit located on the device worn by or in the possession of the subject.

As used herein, a "medical sensor" refers to an appliance or apparatus that measures or monitors a dynamic bodily function, process or condition. Examples of medical sensors are those that measure or monitor heart rate, temperature, blood oxygen or other blood gasses, an electrocardiogram, or an electroencephalogram.

As used herein, a "removable" device refers to an object or device that a subject or a person attending the subject can place on, or remove from, the body, clothing or an accessory (such as a wallet or in a purse or bag) of the subject at will. The removable device is adapted to be worn on a daily basis, at all times, or at only particular times chosen by the subject, such as, but not limited to, during sleep, exercise, at home, travel, work, outdoors, or indoors.

A system and method are disclosed to assist a medical professional or responder to identify and provide appropriate medication and care to subjects unable to communicate for themselves in non-emergency or emergency scenarios.

One aspect of the present application relates to a first system for providing identification and information. In a particular embodiment, as illustrated in FIG. 1, the first system **100** collects a subject's medical biographical information **110** from various sources, such as the subject's doctors' offices, medical facilities that the subject has visited in the past, and medical records or notes prepared or assembled by the subject. Examples of the subject's medical biographical information **110** include name, sex, date of birth, height, weight, blood type, allergies, sicknesses/medical conditions, use of prescribed medications, emergency contacts, as well as complete medical records if available.

In a particular embodiment, the system **100** electronically stores the subject's medical biographical information **110** in a database of a computer system **120**. In some embodiments, the subject's medical biographical information **110** stored in the database is updated by the subject's doctors or the subject as needed. The first system **100** embeds the stored subject's medical biographical information **110** in a readable code **132** of a device **130** that is worn by or in the possession of the subject **140**. In some embodiments, the device **130** is a bracelet, pendant, key chain, fob, belt clip, dog tag, necklace,

5

jewelry, button or other object that is worn by the subject. In particular embodiments, the device **130** is kept in the subject's wallet, purse or pocket. In particular embodiments, the device is water resistant, water proof or comprises a water proof coating or sheath that protects the readable code. In particular embodiments, the device is wear resistant, wear proof or comprises a wear proof coating or sheath that protects the readable code.

In another embodiment, the device **130** is a card or a computer readable device, such as, but not limited to, a flash drive, solid state storage device, compact disc, or digital video disc (DVD). In particular embodiments, the readable code is contained on the removable device in electronic form.

In other particular embodiments, the readable code is present on the removable device in a printed form. In further embodiments, the printed form may be in the form of a bar code, a binary code, a matrix code, pictogram or a quick response (QR) code.

In some embodiments, the readable code is present on the removable device in both an electronic form and in a printed form. In some further embodiments, the data stored in electronic form and in printed form on the removable device is the same. In other further embodiments, the data stored in electronic form and in printed form on the removable device is different.

In some embodiments, the readable code is. In other embodiments, the readable code is non-encrypted code. In still other embodiments, the readable code is a combination of encrypted code and non-encrypted code.

In particular embodiments, a responder **150** uses an appliance **160** to scan the readable code **132** of the device **130** worn by, or in the possession of, the subject **140**. In particular embodiments, the appliance **160** obtains the subject's medical biographical information **110**, which may include, for example, the subject's name, sex, date of birth, height, weight, blood type, allergies, medical histories and conditions, sicknesses, use of prescribed medications, emergency contacts, as well as the complete medical records if available.

In particular embodiments, the responder **150** is a paramedic, emergency medical technician (EMT), fire fighter, policeman/woman, medical professional, or care worker. The term "medical professional" or "medical practitioner" as used herein, includes any person who cares for the medical needs of a subject such as, but not limited to, a physician, surgeon, dentist, chiropractor, osteopath, nurse, nurse's aide, orderly or volunteer.

In some embodiments, the appliance **160** is a handheld scanner. In other embodiments, the appliance **160** is a cellular telephone or a computer, including, but not limited to a laptop, pad or tablet computer. In particular embodiments, the appliance **160** includes an integrated display that displays the subject's medical biographical information **110** to assist the responder on the scene to provide care to the subject **140**. In another embodiment, the obtained medical biographical information **110** is displayed on a computer or other appliance or equipment. In a particular embodiment, the appliance and/or display is located in an emergency vehicle **170**.

In another embodiment, the first system **100** transmits the medical biographical information **110** to a medical facility **180** that is designated to receive the subject **140**. The designated medical facility **180** uses the medical biographical information **110** and the current medical needs of the subject **140** to develop a plan for medical care. In a particular embodiment, said plan for medical care is developed before the subject arrives at the designated medical facility **180**.

In a particular embodiment, the medical facility **180** is a hospital. In another particular embodiment, the medical facil-

6

ity **180** is an emergency room. In another particular embodiment, the medical facility **180** is an outpatient facility, including an outpatient urgent care facility. In another particular embodiment, the medical facility **180** is a clinic. In another particular embodiment, the medical facility **180** is a nursing home. In another particular embodiment, the medical facility **180** is a physician's office. In yet another particular embodiment, the medical facility **180** is a dentist's office.

In particular embodiments, transmittal of the medical biographical information **110** and the current medical needs of the subject **140** to the medical facility **180** allows a medical professional **190** at the medical facility **180** to be prepared for the subject's **140** arrival.

In particular embodiments, a medical professional **190** and/or responder **150** submits updated medical biographical information **110** to the database **120**. In another embodiment, the subject submits updated medical biographical information **110** to the database **120**. In particular embodiments, the updated medical biographical information **110** is automatically synced with data embedded in the readable code **132** of the device **130**.

In a particular embodiment, the device **130** comprises a GPS or other tracking circuit **134**. In particular embodiments, the medical professional **190** tracks the location of the subject **140**. In a particular embodiment, the distance and the travel time before arrival at the medical facility **180** is determined.

In particular embodiments, the first system **100** is used for emergency circumstances. In other particular embodiments, the first system **100** is used for non-emergency circumstances. In a related embodiment, the non-emergency circumstance is transport of a subject **140** from one medical facility **180** to a different medical facility **180**.

FIG. 2 is a flow chart showing a non-limiting example of an embodiment of a method **200** for providing identification and medical information. In a particular embodiment, method **200** comprises the collection and storage of medical biographical information of the subject **204**. In a particular embodiment, the medical biographical information is embedded in a readable code of a device that is adapted to be worn by or in the possession of the subject **206**. In particular embodiments, an appliance reads the readable code **208** of the device **206** to retrieve the medical biographical information of the subject **204**. In some embodiments, the retrieved medical biographical information **204** is displayed on a computer screen located in an emergency vehicle **210**. In particular embodiments, the retrieved medical biographical information **204** is wirelessly transmitted to a medical facility that is designated to receive the subject **212**. In some embodiments, the location of the subject is determined using a GPS tracking circuit located on the device worn by the subject **214**. In particular embodiments, the medical biographical information **204** is updated by a medical professional or responder **216**.

In particular embodiments, as illustrated in FIG. 3, the system disclosed in the present application comprises a computer system or server **300** for implementing embodiments of the system **100** (FIG. 1) and method **200** (FIG. 2) for providing identification and medical information. In an exemplary embodiment, the computer system or server **300** is the computer system **120** of FIG. 1. In particular embodiments, the computer system or server **300** includes and executes software programs to perform functions described herein, including the steps of the method **200** described above. In other embodiments, computer system **300** is a mobile device that performs the steps of the method **200** described above. In particular embodiments, The computer system **300** connects with a network **318**, to receive inquiries, obtain data, and

transmit information as described above. In some embodiments, the network is the internet. In other embodiments, the network is an intranet, WAN, or LAN.

In an exemplary embodiment, the computer system **300** includes a memory **302**, a processor **314**, and, optionally, a secondary storage device **312**. In some embodiments, the computer system **300** includes a plurality of processors **314** and is configured as a plurality of, e.g., bladed servers, or other known server configurations. In particular embodiments, the computer system **300** also includes an input device **316**, a display device **310**, and an output device **308**. In some embodiments, the memory **302** includes RAM or similar types of memory. In particular embodiments, the memory **302** stores one or more applications for execution by the processor **314**. In some embodiments, the secondary storage device **312** includes a hard disk drive, floppy disk drive, CD-ROM or DVD drive, or other types of non-volatile data storage. In particular embodiments, the processor **314** executes the application(s) that are stored in the memory **302** or the secondary storage **312**, or received from the internet or other network **318**. In some embodiments, processing by the processor **314** may be implemented in software, such as software modules, for execution by computers or other machines. These applications preferably include instructions executable to perform the functions and methods described above and illustrated in the Figures herein. The applications preferably provide GUIs through which users may view and interact with the application(s).

In some embodiments, the processor **314** may execute one or more software applications in order to provide the functions described in this specification, specifically to execute and perform the steps and functions in the methods described above. Such methods and the processing may be implemented in software, such as software modules, for execution by computers or other machines. The GUIs may be formatted, for example, as web pages in HyperText Markup Language (HTML), Extensible Markup Language (XML) or in any other suitable form for presentation on a display device depending upon applications used by users to interact with the system **100**.

In particular embodiments, the input device **316** may include any device for entering information into the computer system **300**, such as a touch-screen, keyboard, mouse, cursor-control device, microphone, digital camera, video recorder or camcorder. The input device **316** may be used to enter information into GUIs during performance of the methods described above. In some embodiments, the display device **310** may include any type of device for presenting visual information such as, for example, a computer monitor or flat-screen display, mobile device screen, or a printer. The display device **310** may display the GUIs and/or output from a software program. In particular embodiments, the output device **308** may include any type of device for presenting a hard copy of information, such as a printer, and other types of output devices include speakers or any device for providing information in audio form.

Exemplary embodiments of the computer system **300** include dedicated server computers, such as bladed servers, personal computers, laptop computers, notebook computers, palm top computers, network computers, mobile devices, or any processor-controlled device capable of executing a web browser or other type of application for interacting with the system.

In particular embodiments, the first system **100** and/or method **200** may use multiple computer systems or servers as necessary or desired to support the users and may also use back-up or redundant servers to prevent network downtime in

the event of a failure of a particular server. In addition, although aspects of an implementation consistent with the above are described as being stored in the memory **302**, one skilled in the art will appreciate that these aspects can also be stored on or read from other types of computer program products or computer-readable media, such as secondary storage devices **312**, including hard disks, floppy disks, or CD-ROM; DVD or other forms of RAM or ROM. In particular embodiments, the computer-readable media may include instructions for controlling a computer system, such as the computer system **300**, to perform a particular method, such as the methods described above.

One aspect of the present application relates to a removable device that is adapted to be worn or in the possession of the subject, as exemplified in the non-limiting example shown in FIG. 4. The device **130** comprises a readable code **132** that contains medical biographical information of the subject, a programmable reporter **401** that electronically stores at least one particular event relating to the subject, and a signal producing element **402** functionally related to the programmable reporter element.

In a particular embodiment, the removable device **130** that is adapted to be worn or in the possession of the subject consists of a readable code **132** that contains medical biographical information of the subject, a programmable reporter element that is programmed by a second system that electronically stores at least one particular event relating to the subject, and a signal producing element functionally related to the programmable reporter element.

In a particular embodiment, the reporter element **401** is programmed to store data regarding at least one particular event relating to the subject and an algorithm for producing an alert signal in the signal producing element **402** to inform the subject of the at least one particular event relating to the subject. In a further embodiment, the alert signal is a light signal. In another embodiment, the signal is an audible signal. In yet another embodiment, the alert signal is a vibrating signal. In yet another embodiment, the alert signal is an alphanumeric display on a LED or LCD display. In yet another embodiment, the alert signal is a signal transmitted from the device to a caregiver or medical practitioner. In yet another embodiment, the device comprises two or more alert signals that are functionally related to the programmable reporter element, comprising two or more of the same type of alert signal or any combination thereof. In a particular embodiment, the reporter element is a separate element of the removable device **130** from the readable code **132**.

In particular embodiments, at least one signal producing element of the device is a transmitter. In a related embodiment, the reporter element signals notification of an upcoming event and/or an unfulfilled event related to the subject to a family member, friend, caregiver and/or medical practitioner.

In a particular embodiment, the removable device further comprises a power source for the reporter element and the signal producing element. In a further embodiment, the power source is a battery. In a still further embodiment, the battery is rechargeable. In another still further embodiment, the battery is removable. In another further embodiment, the removable device further comprises a solar cell for recharging the power source.

In a particular embodiment, the removable device that is adapted to be worn or in the possession of the subject consists of a readable code that contains medical biographical information of the subject, a programmable reporter element that is programmed by a second system that electronically stores at least one particular event relating to the subject, a signal

producing element functionally related to the programmable reporter element, and a power source.

Another aspect of the present application relates to a system for providing identification and medical information of a subject in a removable device, comprising: a database for collecting and storing medical biographical information of the subject; a removable device that is adapted to be worn by or in the possession of the subject, the device including a readable code that contains medical biographical information; and an appliance for scanning the readable code of the device worn by or in the possession of the subject to retrieve the medical biographical information of the subject, wherein the medical biographical information allows responders to obtain the subject's medical information in order to provide care and wherein the device is not linked to a medical sensor and is worn by the subject in a non-hospital setting, and wherein the device worn by or in the possession of the subject further comprises a reporter element that provides a signal to inform the subject of at least one particular event relating to the subject.

In a particular embodiment, said reporter element is programmed manually.

In another particular embodiment, said reporter element is programmed by a second system that electronically stores at least one particular event relating to the subject. In a further particular embodiment, the second system is the same as the first system. In another further particular embodiment, the second system is separate from the first system.

In a particular embodiment, the at least one particular event is an appointment. In some embodiments, the appointment is a follow-up to a visit by the subject to a medical facility. In a further embodiment, the appointment is a medical appointment. In some embodiments, the medical appointment is selected from the group consisting of a physical examination, a physical therapy session, a mental examination and a mental therapy session. In another particular embodiment, the event is a reminder to schedule an appointment.

In a particular embodiment, the reporter element is programmed to issue a signal a predetermined time prior to the event. In a related embodiment, the predetermined time is about one month prior to the event. In another related embodiment, the predetermined time is about two weeks prior to the event. In another related embodiment, the predetermined time is about one week prior to the event. In other related embodiments, the predetermined time is about 30, 28, 25, 21, 20, 15, 14, 7, 6, 5, 4, 3, 2 or 1 day(s) prior to the event. In another related embodiment, the predetermined time is about 24, 18, 12, 6, 5, 4, 3, 2, or 1 hour(s) prior to the event.

In a particular embodiment, the signal repeats or remains until the subject fulfills the event and the reporter element is reset. In a particular embodiment, the reporter element is reset by the subject. In another particular embodiment, the reporter element is reset by a relative, friend or caregiver. In another particular embodiment, the reporter element is reset by a medical practitioner. In a particular embodiment, the reporter element is reset manually. In another particular embodiment, the reporter element is reset by resetting the second system.

In another particular embodiment, the reporter element is programmed to issue an alert signal a predetermined time

after the event if the event was not fulfilled or the reporter element was not reset. In a related embodiment, the warning signal is issued on a repeating basis. In a related embodiment, the predetermined time is 15, 30, 45 or 60 minutes after the scheduled time of the event. In another related embodiment, the predetermined time is 1, 2, 3, 4, 5, 6, 12, 18 or 24 hour(s) after the scheduled time of the event. In another related embodiment, the predetermined time is 1, 2, 3, 4, 5, 6, 7, 14, 15, 20, 21, 25, 28 or 30 day(s) after the scheduled time of the event.

In some embodiments, the reporter element is programmed to issue an alert signal before an event in addition to, if the event is not fulfilled by the subject, after said event. In particular embodiments, the signals before and after the event are the same. In other particular embodiments, the signals before and after the event are different.

In a particular embodiment, if the subject fails to fulfill the event, the second system alerts a medical practitioner.

The above description is for the purpose of teaching the person of ordinary skill in the art how to practice the present invention, and it is not intended to detail all those obvious modifications and variations of it which will become apparent to the skilled worker upon reading the description. It is intended, however, that all such obvious modifications and variations be included within the scope of the present invention, which is defined by the following claims. The claims are intended to cover the components and steps in any sequence which is effective to meet the objectives there intended, unless the context specifically indicates the contrary.

What is claimed is:

1. Anon-transitory computer readable medium providing instructions for providing identification and medical information, comprising:

collecting and storing medical biographical information of a subject;

embedding the medical biographical information comprising one or more of the blood type, allergies, sicknesses or medical conditions, use of medications, emergency contacts, and complete medical records in a readable code of a removable device that is adapted to be worn by or in the possession of the subject;

scanning the readable code of the device worn by or in the possession of the subject using an appliance to retrieve the medical biographical information of the subject;

wherein the medical biographical information allows responders to obtain the subject's medical information in order to provide medical care and wherein the device is not linked to a medical sensor and is worn by the subject in a non-hospital setting; and

programming a reporter element that provides a signal to a functionally linked signal producing element to inform the subject of at least one particular event relating to the subject, wherein said programming is by a second system that electronically stores at least one particular event relating to the subject.

2. The computer readable medium of claim 1, comprising instructions for resetting the reporter element after the subject fulfills the event.
